

第69回日本癌学会一般演題（示説）

セッション名；頭頸部がん（1）

セッション日時：2010年9月24日（木）16：50－17：40

発表会場：大阪国際会議場

英文演題名：

A spontaneous regression case of an elderly patient with plasmacytoma in the nasal cavity

和文演題名：

高齢者の鼻腔原発形質細胞腫の自然退縮の一例

N. Maki Maki Rehabilitation Hospital, Osaka, Japan

抄録本文：

A 91-year-old male suffered from the recurrence of plasmacytoma in the nasal cavity eight months after a surgical treatment done in August 2003. The upper jawbone and hard palate were destroyed by the swelling tumor with a pain. He didn't receive any aggressive therapy except for the "Shiraku" acupuncture treatment once a week for four months since April 2004. Swelling of the right cheek and a pain disappeared within six weeks after the treatment started. The majority of the tumor disappeared within two months. He didn't have any fever or bacterial infection during the period. The complete remission, including the entire bone regeneration, was confirmed within two years. The causal relationship and the actual mechanism between the "Shiraku" acupuncture treatment and the spontaneous regression shown in this report were still unclear.

キーワード：

plasmacytoma, spontaneous regression, "Shiraku" acupuncture
